## Co-PIs

Rick Golightly (HSU)  
Dan Robinette, Jaime Jahnke (PBCS)  
Breck Tyler (UCSC)

## Collaborators

Eric Nelson, Ken Griggs,  
Gerry McChesney (USFWS),  
Harry Carter

## Indispensable staff & students

Phil Capitolo (UCSC)  
Steph Schneider (Moss Landing)  
Shannon Murphy (HSU)  
Betsy Elkinton (HSU)  
Derek Harvey (HSU)  
Eric Irvin (HSU)  
Julie Howar (PBCS)  
Crystal Shore (HSU)

## Partners

California State Parks, Bureau of Land  
Management, HSU-CNRS, CDFW,  
Tolowa Dee-ni'

## Funding and support

Ocean Science Trust, CA SeaGrant,  
NCSR Baseline Program

# Rationale for Seabird Monitoring

- Uniquely observable apex predators
- Unique functional groups in marine ecosystems
- May benefit directly or indirectly from MPAs
- May indicate change caused by MPAs

# North Coast Seabirds 101

- 4 seabird species account for the vast majority of the North Coast's nesting seabirds:
  - Brandt's Cormorant
  - Western Gull
  - Common Murre
  - Cassin's Auklet
- Other breeding species:
  - Fork-tailed Storm-Petrel
  - Leach's Storm-Petrel
  - Pelagic Cormorant
  - Double-crested Cormorant
  - Pigeon Guillemot
  - Rhinoceros Auklet
  - Tufted Puffin
  - Marbled Murrelet (odd one)
  - Black Oystercatcher (odd one)

# Nesting substrates

**Cliff ledges:**  
Pelagic Cormorant

**Ledges through flats:**  
Western Gull  
Common Murre

**Flat rocks/soil:**  
Double-crested Cormorant  
Brandt's Cormorant

**Subterranean:**  
Fork-tailed Storm-Petrel  
Leach's Storm-Petrel  
Rhinoceros Auklet  
Cassin's Auklet  
Pigeon Guillemot  
Tufted Puffin

# Diet and foraging locations

**Offshore**

**Brandt's Cormorant**  
Tufted Puffin

Cassin's Auklet  
Fork-tailed Storm-Petrel  
Leach's Storm-Petrel

**Both/either**

**Common Murre**  
**Pigeon Guillemot**  
Rhinceros Auklet

**Nearshore**

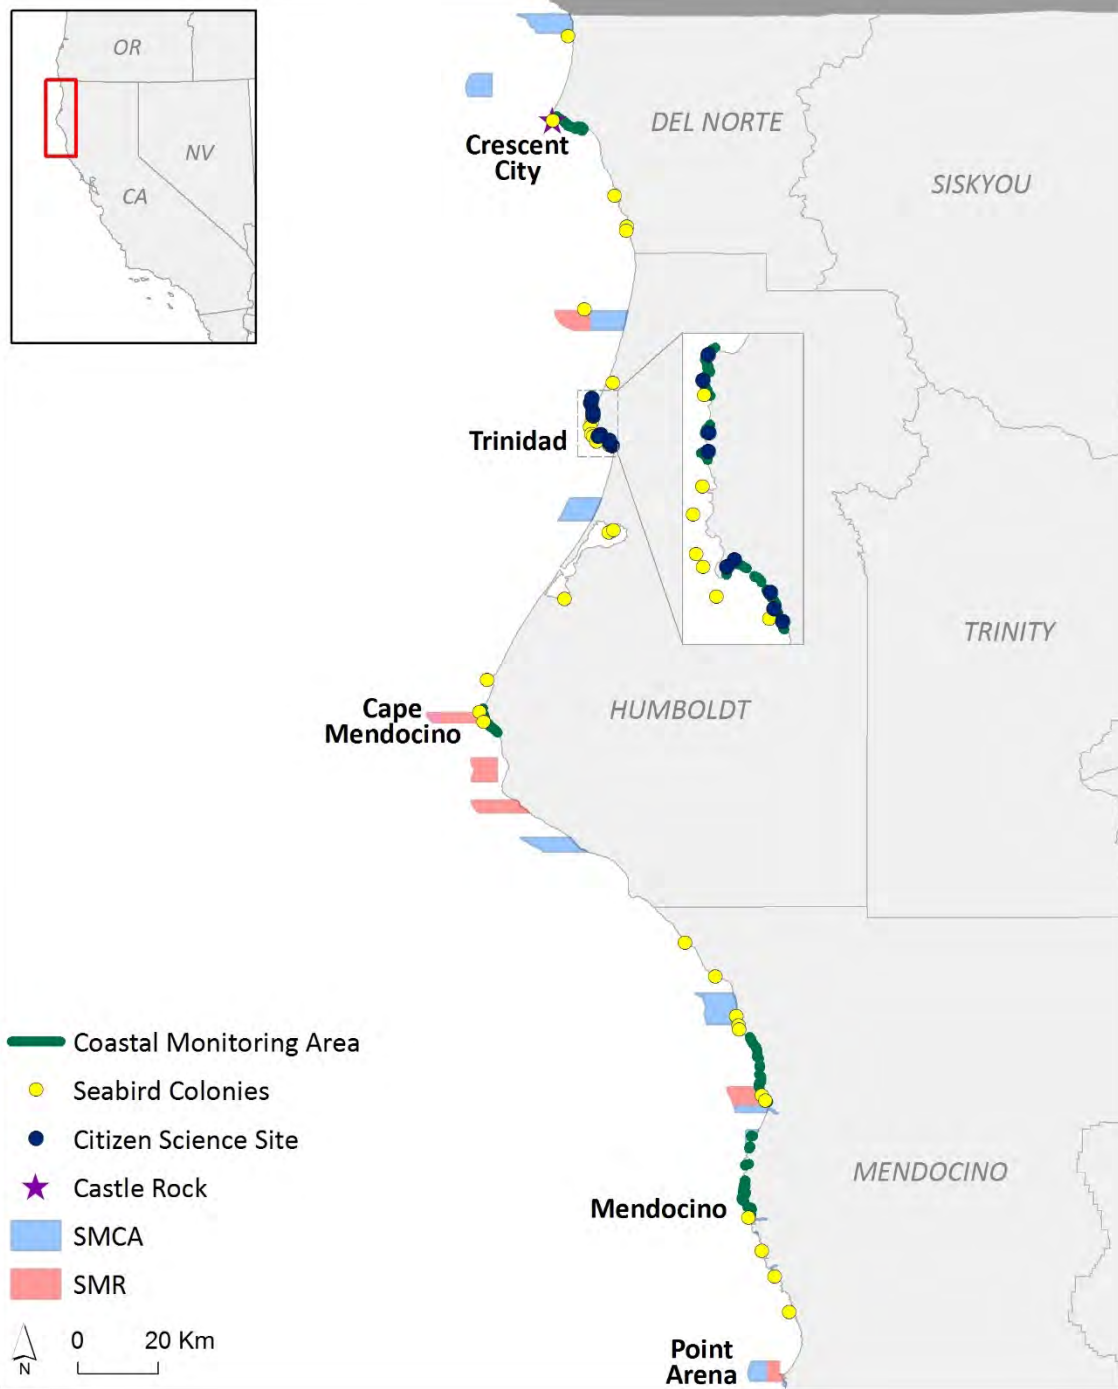

**Pelagic Cormorant**  
**Double-crested Cormorant**  
Marbled Murrelet

# Design, Sites, and Methods

Three complimentary methods:

- 1) Trends in seabird abundance via aerial colony counts: 1989-2014 (14 murre, 8 brandt's)
- 2) Shore-based monitoring: 2014-2015 (and citizen-science cross-validation)
- 3) Intensive productivity and diet monitoring at Castle Rock via remote camera: 2014 (stay for the next presentation)

# Trends in Seabird Abundance: Methods

Region-wide baseline counts of all colonies conducted in 2014

Available raw photos from 1989-2014 counted for “index colonies” at Castle Rock and Cape Vizcaino/Rockport Rocks

Additional data shared by collaborators

Aerial photographs (digital and, back in the day, slides) collected at elevations of 650-1000' in a CDFW Partenavia P-68

Observers: Phil Capitolo, Michael Parker, Allison Fuller

Complete counts of all birds in photos: Phil Capitolo, Steph Schneider, Crystal Shore

# Audience participation: how many murre?

# Audience participation: how many murrelets?

1245

# State-wide Baseline 1989

## Along the North Coast:

- 1) A large portion of California's seabirds (Point Arena-Tolowa was 41% in the 1989-1991)
- 2) A large portion of that fraction is concentrated in two places:
  - Castle Rock
  - Trinidad-Patrick's Point

# Region-wide Baseline 2014

**Common Murre:**  
350,923 birds  
19 colonies  
41% at Castle Rock

**Brandt's Cormorant:**  
6,689 birds and 4,583 nests  
20 colonies (19 with nests)

**Double-crested Cormorant:**  
2,589 birds and 1,825 nests  
13 colonies

**Brown Pelican:**  
1,060 roosting birds  
14 sites

# Trend Analysis

Common Murre:

173 obs. of attendance at 14 colonies during 1989-2014

Brandt's Cormorant:

123 obs. of attendance at 10 colonies during 1989-2014

'State-space' model of growth and observation:

First-order Markovian growth model

$$\log(N_{i,t+1}) = \log(N_{i,t}) + r_{i,t}$$

Linear effect of SOI on annual growth

$$r_{i,t} = \beta_{0_{i,t}} + \beta_1 \text{soi}_t$$

Variation among colonies normally distributed

$$\beta_{0_{i,t}} \sim N(\overline{\beta_{0_i}}, \sigma_i^p)$$

Normally distributed observation error

$$y_{i,t} \sim N(\log(N_{i,t}), \sigma_i^o)$$

# Common Murre Cape Vizcaino "Index"

Gray ribbon is the 95% credible interval of population size estimate

# Common Murre – Blank Rock

# Common Murre by colony

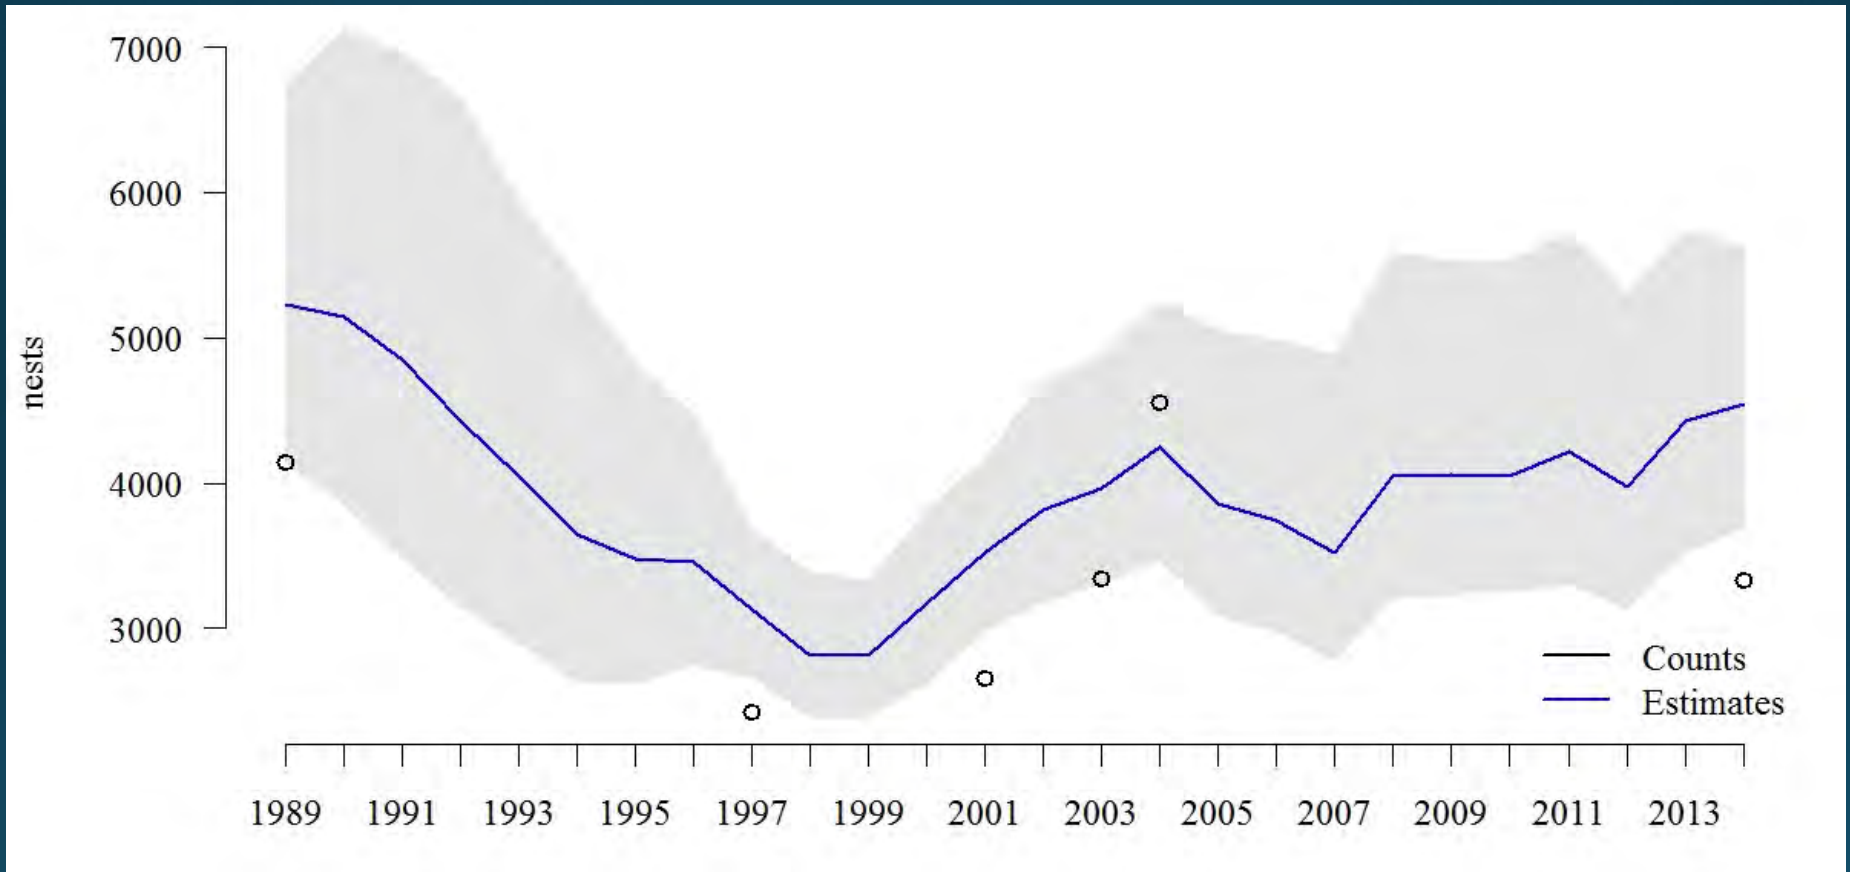

# Common Murre Region-wide

Region-wide mean annual growth rate was 4.0% per year

Colony-specific mean annual growth rates varied from -6.9% to 16.9%

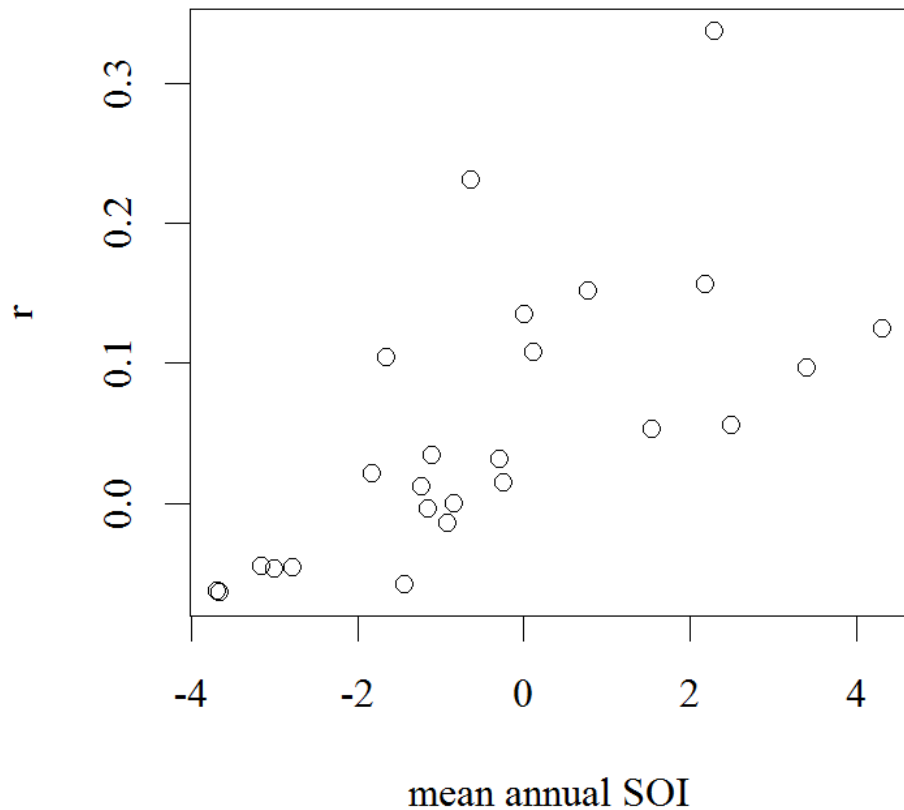

# Brandt's Cormorant Region-wide

Region-wide mean annual growth rate was -0.9% per year

Colony-specific mean annual growth rates varied from -4.4% to 3.6%

# El Niño and murrees

Estimated slope of effect  
of SOI on  $r = 0.0228$

Posterior probability of  
positive effect of SOI  $\sim 1$

# El Niño and cormorants

Estimated slope of effect  
of SOI on  $r = 0.0198$

Posterior probability of  
positive effect of SOI = 0.954

# Trend Monitoring Effectiveness

# Near-shore monitoring: Nest success

# Near-shore monitoring: Disturbance Rates

**Figure 14.** Mean  $\pm$  SE number of disturbances observed per hour of observation for areas within each of the four MLPA study regions. SCSR = South Coast Study Region, CCSR = Central Coast Study Region, NCCSR = North Central Coast Study Region, NCSR = North Coast Study Region, SD = San Diego, PV = Palos Verdes Peninsula, SB = Shell Beach, MD = Montaña de Oro, EB = Estero Bluffs, MO = Montara, PR = Point Reyes, BO = Bodega, ME = Mendocino, HU = Humboldt, and DN = Del Norte.

# Near-shore monitoring: Foraging Observations

# Near-shore monitoring: Roosting

# Trinidad citizen science cross-validation

# Future and integration

Uniquely observable apex predators – especially population growth, reproductive success, diet

Opportunity to continue to establish historic baseline from pre-existing data

Opportunity for strong treatment-control designs (shore-based) or BACI designs (aerial surveys)

Additional contextual data beyond SOI (help.)
